1144554	Tornado	21	\$10,000,000	True	False
1144555	Tornado	1	\$10,000,000	True	False
Total		698	\$2,470,333,230		

Projected Damages

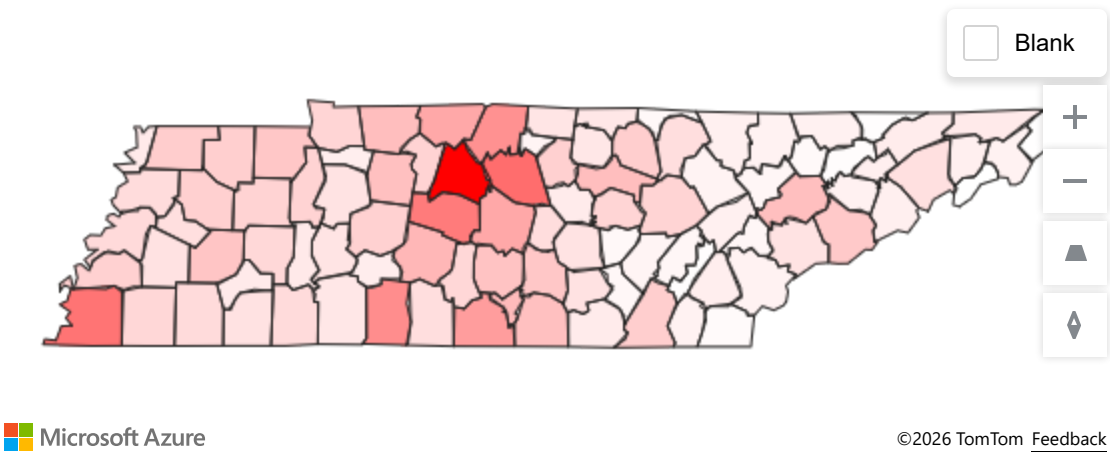

Projected Year	Projected Avg Damage Per Event	Projected Damage Per Year
2026	191,330.52	296,562,302.77
2027	189,908.82	294,358,671.19
2028	188,487.12	292,155,039.61
2029	187,065.42	289,951,408.03
2030	185,643.73	287,747,776.45
Total	3,071,690.25	4,761,119,884.06

Projected damages are only an estimation, but they are conservative and only based on property and crop damages.

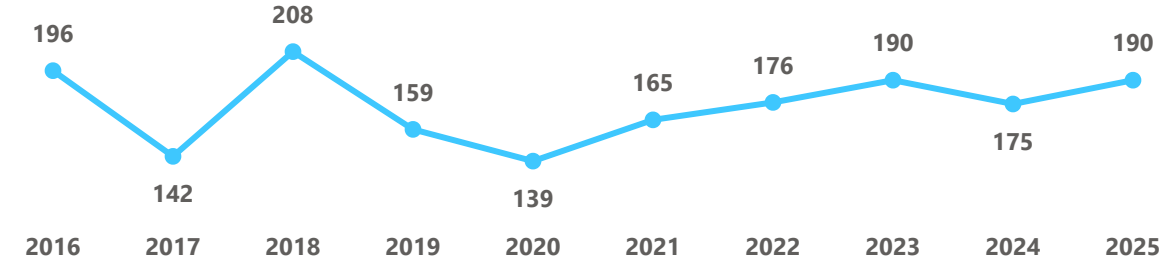

If damages aren't addressed, a growing population and increased development may incur storm damages up to 4 billion \$ in 5 years.

How has county vulnerability to storms changed over time?

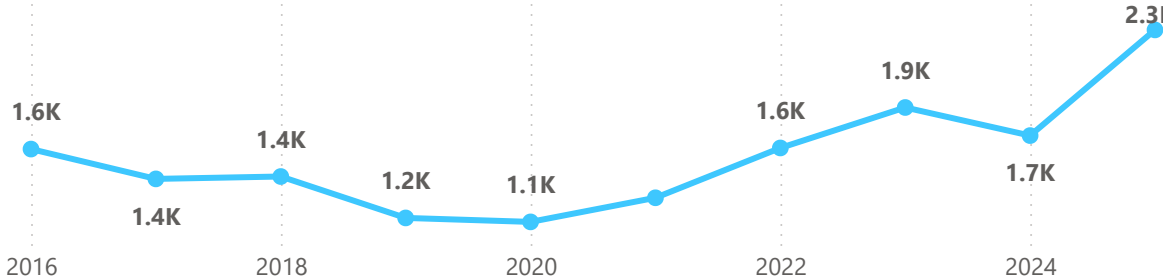

Damage Severity Per County

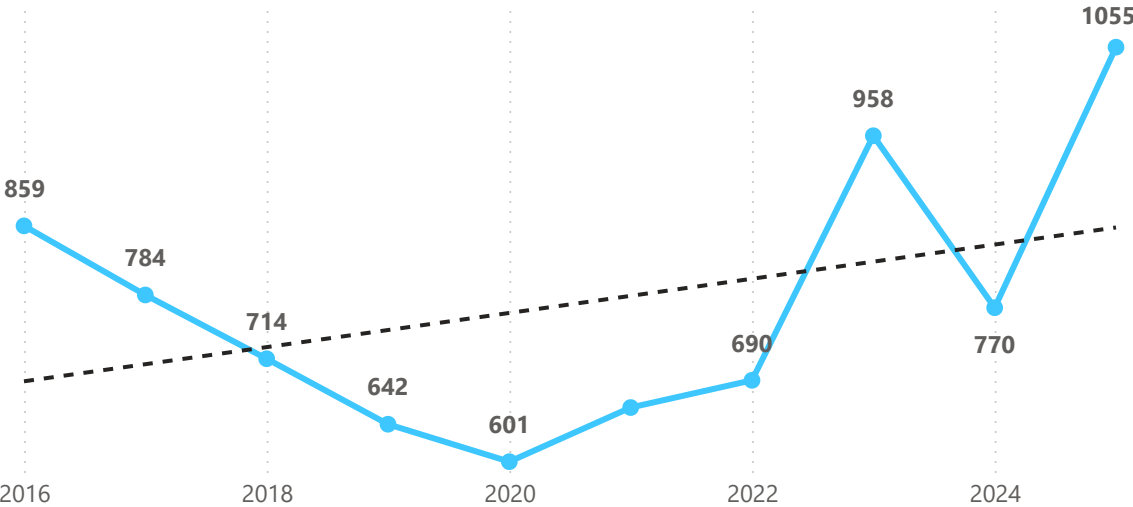

Total Storms

Damage Severity Over Time

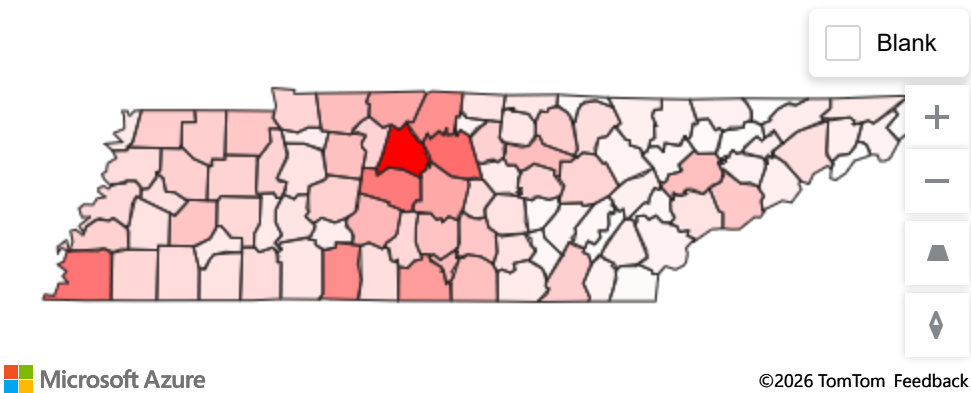

Damage Severity Changes

County Name	Total Damage Severity	Yearly Rate of Change	Severity Difference 2025 - 2016
LINCOLN	182.94	4.26	51.54
HENRY	110.67	2.60	34.22
LAUDERDALE	76.60	1.69	25.55
MOORE	130.62	1.28	18.27
FRANKLIN	122.53	1.13	18.01
CARROLL	80.17	1.03	17.11
Total	7,732.50	18.71	195.66

What disaster types drive major damages in TN counties?

Damage Severity Per County

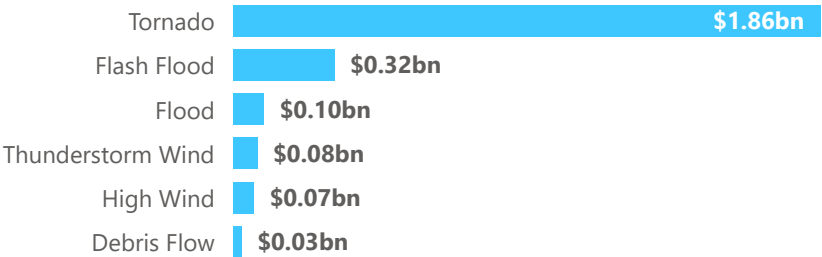

- West and Middle TN are impacted more strongly by Tornadoes and Winter Storms.
- West TN is abnormally uniform in its susceptibility to heat and cold related deaths.
- High heat and cold related deaths rank higher than tornadoes for avg deaths in Davidson & Shelby County
- High winds disproportionately affect East TN causing major crop damages.

How has damage severity changed over time?

Conclusions:

The number of storms is staying relatively constant while damage severity and the number of damage reports and county damage severity score is increasing. Seems to imply counties are becoming more vulnerable to storms.

The highest severity areas typically being cities, this is likely primarily due to population density.

- Metrics like power outages, road closures, property damages, crop damages, injuries, and fatalities are all more likely to occur in cities.

Nonetheless, some counties like Davidson and Wilson counties have reduced their damage severity score over time while other counties have gotten worse. However, 62% of counties are worsening over time.

- areas of opportunity include counties in West and Middle TN.
 - Tornadoes disproportionately affect these counties
- Heat related and cold related deaths are more common in West TN and Davidson County.
- winters produce more road closures in West and Middle TN, suggesting an opportunity for winter road preparation in these areas.

Sevier and Greene county experience the greatest crop damages due to strong winds.
